
A MB peak, same electrode, before vs after
Before incubation ($F_k = 0$)
After incubation ($F_k = 0.5$, example)
Peak shrinkage $\propto F_k$
ΔI (nA)
Potential (mV vs Ag/AgCl)
B Before/after recovery, noise-free
Noise floor for this simpler measurement has not yet been derived -- not shown here, see Part E.
Recovered F_k^{rec}
True F_k
Ideal ($F_k^{rec} = F_k$)
Recovered (noise-free)
C Frequency diagnostic
$P(d)$-averaged model
Single k^0 at mean d
Operating 10 Hz
ΔI_{peak} (normalised)
SWV frequency f (Hz)
D Quadrature convergence
$n_{dist} = 80$ (used)
< 0.5% error
Relative error vs $n_{dist} = 160$ (%)
Quadrature points n_{dist}
